Chapter 1

README

Place your project here

Chapter 2

Class Index

2.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

item	Represents an item in the backpack problem	7
plecak	Represents a backpack in the backpack problem	8
populacja	Represents a population in the backpack problem	9

Chapter 3

File Index

3.1 File List

Here is a list of all documented files with brief descriptions:

functions.h	13
structures.h	19

Chapter 4

Class Documentation

4.1 item Struct Reference

Represents an item in the backpack problem.

```
#include <structures.h>
```

Collaboration diagram for item:

Public Attributes

- `std::string` **name**
- `double` **weight**
- `double` **value**
- `int` **numer**

4.1.1 Detailed Description

Represents an item in the backpack problem.

The item structure contains the following properties:

Parameters

<i>name</i>	Name of the item
<i>weight</i>	Weight of the item
<i>value</i>	Value of the item
<i>numer</i>	Number of the item

The documentation for this struct was generated from the following file:

- [structures.h](#)

4.2 plecak Struct Reference

Represents a backpack in the backpack problem.

```
#include <structures.h>
```

Collaboration diagram for plecak:

Public Attributes

- `std::vector< bool > przedmioty`
- `double waga`
- `double wartosc`

4.2.1 Detailed Description

Represents a backpack in the backpack problem.

The plecak structure contains the following properties:

Parameters

<i>przedmioty</i>	Vector of booleans representing whether an item is in the backpack or not
<i>waga</i>	Total weight of the items in the backpack
<i>wartosc</i>	Total value of the items in the backpack

The documentation for this struct was generated from the following file:

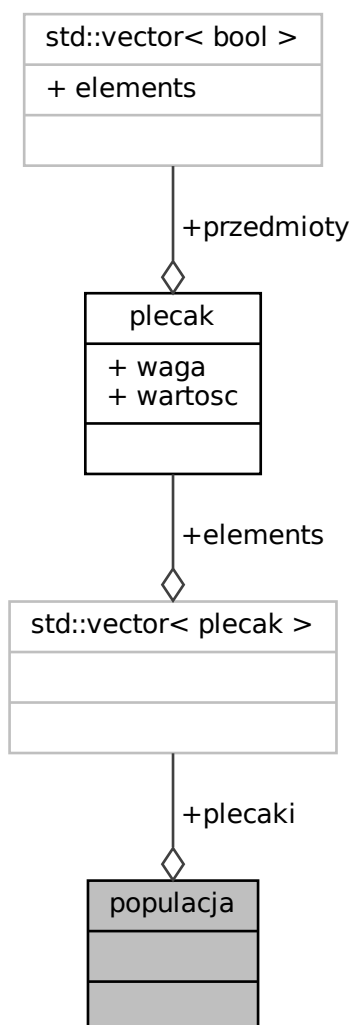

- [structures.h](#)

4.3 populacja Struct Reference

Represents a population in the backpack problem.

```
#include <structures.h>
```

Collaboration diagram for `populacja`:

Public Attributes

- `std::vector< plecak > plecaki`

4.3.1 Detailed Description

Represents a population in the backpack problem.

The `populacja` structure contains the following properties:

Parameters

<i>plecaki</i>	Vector of backpacks in the population
----------------	---------------------------------------

The documentation for this struct was generated from the following file:

- [structures.h](#)

Chapter 5

File Documentation

5.1 functions.h File Reference

```
#include <string>
#include <vector>
#include "structures.h"
```

Include dependency graph for functions.h:

Functions

- `std::map< std::string, std::string > paramcheck (int ile, char *param[])`
Parameter checker.
- `std::deque< item > dataread (const std::string &filename)`
Data reader.
- `int randomint (const int &limit)`
Random number generator.
- `plecak generate_knapsack (const std::deque< item > &items, const double &capacity)`
Knapsack generator.

- `populacja generatefirstgen` (const std::deque< `item` > &items, const double &count, const double &capacity)
First generation generator.
- `populacja VWcalcularator` (const std::deque< `item` > &items, `populacja` &generation)
Value-Weight calculator.
- `populacja crossing` (const std::deque< `item` > &items, const `populacja` &generation)
Crossing operation.
- `populacja selection` (const `populacja` &generation, const double &count, const double &capacity)
Select operation.
- `plecak topplecak` (const `populacja` &generation, const double &capacity)
Best solution calculator.
- void `datawrite` (const `populacja` &generation, const double &gen, const std::deque< `item` > &items, const double &capacity, std::ofstream &file)
Data output operation.
- void `genetic` (const std::deque< `item` > &items, const double &count, const double &capacity, const double &gennumber, const std::string &output)
Man genetic function.

5.1.1 Function Documentation

5.1.1.1 crossing()

```
populacja crossing (
    const std::deque< item > & items,
    const populacja & generation )
```

Crossing operation.

Creates new knapsacks by choosing and merging two individuals taken from generation.

Parameters

<i>generation</i>	The current population of knapsacks
<i>items</i>	The set of items

Returns

New population based on previous one

5.1.1.2 dataread()

```
std::deque<item> dataread (
    const std::string & filename )
```

Data reader.

This function reads and checks the data from a file and stores it in a deque of struct items.

Parameters

<i>filename</i>	The name of the file containing the data
-----------------	--

Returns

A deque of struct items

5.1.1.3 datawrite()

```
void datawrite (
    const populacja & generation,
    const double & gen,
    const std::deque< item > & items,
    const double & capacity,
    std::ofstream & file )
```

Data output operation.

Writes the best solution of a generation to the text file with the information about items, total value and weight of an knapsack.

Parameters

<i>generation</i>	The current population of knapsacks
<i>output</i>	The name of the output file
<i>gen</i>	The current generation number
<i>items</i>	The set of items
<i>capacity</i>	The capacity of each knapsack
<i>file</i>	The output file stream

5.1.1.4 generate_knapsack()

```
plecak generate_knapsack (
    const std::deque< item > & items,
    const double & capacity )
```

Knapsack generator.

This function generates a struct variable *plecak* given a set of items and a capacity.

Parameters

<i>items</i>	The set of items
<i>capacity</i>	The capacity of the knapsack

Returns

A knapsack

5.1.1.5 generatefirstgen()

```
populacja generatefirstgen (
    const std::deque< item > & items,
    const double & count,
    const double & capacity )
```

First generation generator.

This function generates the first generation of knapsacks which is made out of structure populacja.

Parameters

<i>items</i>	The set of items
<i>count</i>	The number of knapsacks in the generation
<i>capacity</i>	The capacity of each knapsack

Returns

The first generation of knapsacks

5.1.1.6 genetic()

```
void genetic (
    const std::deque< item > & items,
    const double & count,
    const double & capacity,
    const double & gennumber,
    const std::string & output )
```

Man genetic function.

Generates best solution for knapsack problem by combining other sub-functions.

Parameters

<i>items</i>	The set of items
<i>count</i>	The number of knapsacks in the generation
<i>capacity</i>	The capacity of each knapsack
<i>gennumber</i>	The number of generations to run the algorithm for
<i>output</i>	The name of the output file

5.1.1.7 paramcheck()

```
std::map<std::string, std::string> paramcheck (
    int ile,
    char * param[ ] )
```

Parameter checker.

Checks the parameters passed to the program and stores them in a map, where the keys are the names of the parameters and the map values are their values.

Parameters

<i>ile</i>	The number of parameters passed to the program
<i>param</i>	The array of parameters passed to the program

Returns

A map containing the parameters and their values

5.1.1.8 randomint()

```
int randomint (
    const int & limit )
```

Random number generator.

This function generates a random integer in the range [0, a].

Parameters

<i>limit</i>	The upper bound of the range
--------------	------------------------------

Returns

A random integer

5.1.1.9 selection()

```
populacja selection (
    const populacja & generation,
```

```
const double & count,  
const double & capacity )
```

Select operation.

Selects the best individuals from the current generation based on their fitness value.

Parameters

<i>generation</i>	The current population of knapsacks
<i>capacity</i>	The capacity of each knapsack

Returns

New population based on previous one

5.1.1.10 topplecak()

```
plecak topplecak (  
    const populacja & generation,  
    const double & capacity )
```

Best solution calculator.

Finds best knapsack by comparing all candidates in generation.

Parameters

<i>generation</i>	The current population of knapsacks
<i>capacity</i>	The capacity of each knapsack

Returns

The best solution

5.1.1.11 VWcalculalator()

```
populacja VWcalculalator (  
    const std::deque< item > & items,  
    populacja & generation )
```

Value-Weight calculator.

This function calculates the value and weight of each knapsack in a generation.

Parameters

<i>items</i>	The set of items
<i>generation</i>	The current population of knapsacks

Returns

The updated generation of knapsacks with their values and weights calculated

5.2 structures.h File Reference

```
#include <string>
```

```
#include <vector>
```

Include dependency graph for structures.h:

This graph shows which files directly or indirectly include this file:

Classes

- struct [item](#)
Represents an item in the backpack problem.
- struct [plecak](#)
Represents a backpack in the backpack problem.
- struct [populacja](#)
Represents a population in the backpack problem.
